How can we apply the method of moments to estimate parameters efficiently for a general model?

Chaganty, Liang (Stanford University)

Moments and Likelihoods

Setup

- Discrete models, d, k.
- Assume d > k.
- Parameters and marginals can be put into a matrix or tensor
 -i introduce notation.
- Assume infinite data.
- Highlight directed vs undirected - we focus on directed.

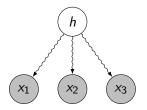

- 20

A D N A B N A B N A B N

Background: Three-view Mixture Models

Definition (Bottleneck)

A hidden variable h is a **bottleneck** if there exist three observed variables (**views**) x_1, x_2, x_3 that are conditionally independent given h.

Chaganty, Liang (Stanford University)

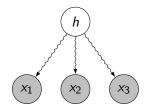

Moments and Likelihoods

Background: Three-view Mixture Models

Definition (Bottleneck)

A hidden variable h is a **bottleneck** if there exist three observed variables (**views**) x_1, x_2, x_3 that are conditionally independent given h.

- Anandkumar, Hsu, and Kakade 2012 provide an algorithm to estimate conditional moments P(x_i | h) based on tensor eigendecomposition.
- In general, three views are necessary for identifiability (Kruskal 1977).

Recovering parameters in undirected log-linear models

Assume a log-linear parameterization, TODO: use sum over cliques - talk through.

$$p_{\theta}(\mathbf{x}, \mathbf{h}) = \exp\left(\theta^{\top} \phi(\mathbf{x}, \mathbf{h}) - A(\theta)\right).$$

 The unsupervised negative log-likelihood is non-convex,

$$\mathcal{L}_{unsup}(\theta) \triangleq \mathbb{E}_{\mathbf{x} \sim \mathcal{D}}[-\log \sum_{\mathbf{h} \in \mathcal{H}} p_{\theta}(\mathbf{x}, \mathbf{h})].$$

• • • • • • • • • • • •

 However, the supervised negative log-likelihood is convex,

$$\begin{split} \mathcal{L}_{\mathsf{sup}}(\theta) &\triangleq \mathbb{E}_{(\mathsf{x},\mathsf{h})\sim\mathcal{D}_{\mathsf{sup}}}\left[-\log p_{\theta}(\mathsf{x},\mathsf{h})\right] \\ &= -\theta^{\top} \left(\sum_{\mathcal{C}\in\mathcal{G}} \mathbb{E}_{(\mathsf{x},\mathsf{h})\sim\mathcal{D}_{\mathsf{sup}}}[\phi(\mathsf{x}_{\mathcal{C}},\mathsf{h}_{\mathcal{C}})]\right) + \mathcal{A}(\theta). \end{split}$$

Recovering parameters in undirected log-linear models

 Recall, the marginals can typically estimated from supervised data.

$$\mathcal{L}_{sup}(\theta) = -\theta^{\top} \underbrace{\left(\sum_{\mathcal{C} \in \mathcal{G}} \mathbb{E}_{(\mathbf{x}, \mathbf{h}) \sim \mathcal{D}_{sup}} [\phi(\mathbf{x}_{\mathcal{C}}, \mathbf{h}_{\mathcal{C}})] \right)}_{\mu_{\mathcal{C}}} + \underline{\mathcal{A}(\theta)}_{\mathbf{x}_{1}^{*}} \underbrace{\begin{array}{c} \theta \\ \theta_{1} \\ \theta_{2} \\ \theta_{$$

$$\mathcal{L}_{sup}(\theta) = -\theta^{\top} \underbrace{\left(\sum_{\mathcal{C} \in \mathcal{G}} \mathbb{E}_{(\mathbf{x}, \mathbf{h}) \sim \mathcal{D}_{sup}} [\phi(\mathbf{x}_{\mathcal{C}}, \mathbf{h}_{\mathcal{C}})] \right)}_{\mu_{\mathcal{C}}} + A(\theta).$$

However, the marginals can also be consistently estimated by moments!

$$\mu_{\mathcal{C}} = \sum_{\mathbf{x}_{\mathcal{C}}, \mathbf{h}_{\mathcal{C}}} \underbrace{\mathbb{P}(\mathbf{x}_{\mathcal{C}} \mid \mathbf{h}_{\mathcal{C}})}_{\text{c ond. moments hidden marginals}} \underbrace{\mathbb{P}(\mathbf{h}_{\mathcal{C}})}_{\mathbf{h}_{\mathcal{C}}, \mathbf{h}_{\mathcal{C}}} \phi(\mathbf{x}_{\mathcal{C}}, \mathbf{h}_{\mathcal{C}})$$

Optimizing pseudolikelihood

Estimating marginals μ_C is independent of treewidth, but computing the normalization constant is: TODO: convex but not easy

$$\mathcal{A}(heta) riangleq \log \sum_{\mathbf{x},\mathbf{h}} \exp\left(heta^ op \phi(\mathbf{x},\mathbf{h})
ight).$$

Optimizing pseudolikelihood

Estimating marginals μ_C is independent of treewidth, but computing the normalization constant is: TODO: convex but not easy

$$\mathcal{A}(heta) riangleq \log \sum_{\mathbf{x},\mathbf{h}} \exp\left(heta^ op \phi(\mathbf{x},\mathbf{h})
ight).$$

 We can use pseudolikelihood (besag75pseudo) to consistently estimate distributions over local neighborhoods.

$$\mathcal{A}_{\mathsf{pseudo}}(heta;\mathcal{N}(a)) \triangleq \log \sum_{a} \exp\left(heta^{ op}\phi(\mathbf{x}_{\mathcal{N}},\mathbf{h}_{\mathcal{N}})
ight).$$

ight).$$

 Clique marginals not sufficient statistics, but we can still estimate them.
